When do you think the class will start communicating?

To: Pete Schwartz

---

Students should probably start by sharing their names, saying a little about themselves...their majors and what they are interested in, and then sharing pictures of some of the things they have built.

The name of the stove communications/coordination staff is Sheillah Kamwendo. She is 23 and has a Bachelors degree in education for special needs, with a History minor (pending) from the Catholic University of Malawi.

I should be at the workshop by Friday of this week, and one of the first things that I will have on my list is getting the daily solar electric cooking routine up and running.

We have more than 250, 150-Watt panels at the workshop, if we can't get some good cooking going with our 40 kilowatts of solar panels, you know we are in trouble.

This means that the cooking should be up and running in full force within a week or two.

Then we will go out into the villages and get some initial pilot distribution going.

In the solar electric cooking struggle,

Robert VB
